In the United States, the primary source of mercury exposure among humans is through consumption of contaminated fish. The remaining wastes typically are put into landfills. Majority of mercury accumulates locally in the plant with little mobility, and only small portions may be released into the atmosphere or transported to other plant organs 7811

Although coal-fired power plants represent the largest source of mercury emissions, for example, mercury from subbituminous coal, common in the western states, is difficult to control because it exists mostly in the elemental form in flue gas. In China, most farmers produce and consume their own vegetables, fruits, grains, and meats because of higher costs for grocery store products and also poor transportation accessibility
