To reduce vulnerability, adaptation planning can be improved by reducing the non-climate stressors on the mangrove area, particularly those resulting from human impacts. Through community surveys this was found to have been linked with human settlement on the island, which likely caused increased pressure on the forest resources for fuelwood, combined with substrate disturbance and disaggregation that would have led to erosion during high tides, leading to inundation stress to the remaining trees. Wetlands and Natural Resource Management. Vulnerabilitycanbereducedbyreductionofotherimpactsonmangroveprodu This result is shown in Table 4along with the long-term net sedimentation rate calculated from the calibrated date and depth. Climate warming is likely to have little negative impact, even increasing mangrove productivity and biodiversity at higher latitudes [ 242830313233 ]. Table 2 Cameroon estuary spatial change in area of vegetation and landuse cover hectares. Despitethesevalues,manymangrovesystemshavebecomedegradedanddestro that have a microtidal range have unique mangrove settings that are important to protect; and, although they have higher exposure to sea level rise, their vulnerability can be reduced by adaptation actions that reduce other stresses. Coastal
